

## Miscellaneous Exercise

## Question 1:

Let  $f: \mathbf{R} \rightarrow \mathbf{R}$  be defined as  $f(x) = 10x + 7$ . Find the function  $g: \mathbf{R} \rightarrow \mathbf{R}$  such that  $g \circ f = f \circ g = I_{\mathbf{R}}$ .

## Answer 1:

It is given that  $f: \mathbf{R} \rightarrow \mathbf{R}$  is defined as  $f(x) = 10x + 7$ .

For one – one

Let  $f(x) = f(y)$ , where  $x, y \in \mathbf{R}$ .

$$\Rightarrow 10x + 7 = 10y + 7$$

$$\Rightarrow x = y$$

$\therefore f$  is a one – one function.

For onto

For  $y \in \mathbf{R}$ , let  $y = 10x + 7$ .

$$\Rightarrow x = \frac{y - 7}{10} \in \mathbf{R}$$

Therefore, for any  $y \in \mathbf{R}$ , there exists  $x = \frac{y-7}{10} \in \mathbf{R}$  such that

$$f(x) = f\left(\frac{y-7}{10}\right) = 10\left(\frac{y-7}{10}\right) + 7 = y - 7 + 7 = y$$

$\therefore f$  is onto.

Therefore,  $f$  is one – one and onto.

Thus,  $f$  is an invertible function.

Let us define  $g: \mathbf{R} \rightarrow \mathbf{R}$  as  $g(y) = \frac{y-7}{10}$

Now, we have

$$g \circ f(x) = g(f(x)) = g(10x + 7) = \frac{(10x + 7) - 7}{10} = \frac{10x}{10} = x$$

and

$$f \circ g(y) = f(g(y)) = f\left(\frac{y-7}{10}\right) = 10\left(\frac{y-7}{10}\right) + 7 = y - 7 + 7 = y$$

$$\therefore g \circ f = I_R \text{ and } f \circ g = I_R.$$

Hence, the required function  $g: \mathbf{R} \rightarrow \mathbf{R}$  is defined as  $g(y) = \frac{y-7}{10}$ .

### Question 2:

Let  $f: W \rightarrow W$  be defined as  $f(n) = n - 1$ , if  $n$  is odd and  $f(n) = n + 1$ , if  $n$  is even. Show that  $f$  is invertible. Find the inverse of  $f$ . Here,  $W$  is the set of all whole numbers.

### Answer 2:

It is given that:

$$f: W \rightarrow W \text{ is defined as } f(n) = \begin{cases} n - 1, & \text{if } n \text{ is odd} \\ n + 1, & \text{if } n \text{ is even} \end{cases}$$

### For one – one

$$\text{Let } f(n) = f(m).$$

It can be observed that if  $n$  is odd and  $m$  is even, then we will have  $n - 1 = m + 1$ .

$$\Rightarrow n - m = 2$$

However, this is impossible.

Similarly, the possibility of  $n$  being even and  $m$  being odd can also be ignored under a similar argument.

$\therefore$  Both  $n$  and  $m$  must be either odd or even. Now, if both  $n$  and  $m$  are odd,

Then, we have

$$f(n) = f(m)$$

$$\Rightarrow n - 1 = m - 1$$

$$\Rightarrow n = m$$

Again, if both  $n$  and  $m$  are even,

Then, we have

$$f(n) = f(m)$$

$$\Rightarrow n + 1 = m + 1$$

$$\Rightarrow n = m$$

$\therefore f$  is one – one.

For onto

It is clear that any odd number  $2r + 1$  in co-domain  $\mathbf{N}$  is the image of  $2r$  in domain  $\mathbf{N}$  and any even number  $2r$  in co-domain  $\mathbf{N}$  is the image of  $2r + 1$  in domain  $\mathbf{N}$ .

$\therefore f$  is onto.

Hence,  $f$  is an invertible function.

Let us define  $g: W \rightarrow W$  as  $g(m) = \begin{cases} m + 1, & \text{if } m \text{ is even} \\ m - 1, & \text{if } m \text{ is odd} \end{cases}$

Now, when  $n$  is odd

$$gof(n) = g(f(n)) = g(n - 1) = n - 1 + 1 = n \text{ and}$$

When  $n$  is even

$$gof(n) = g(f(n)) = g(n + 1) = n + 1 - 1 = n$$

Similarly,

When  $m$  is odd

$$fog(m) = f(g(m)) = f(m - 1) = m - 1 + 1 = m \text{ and}$$

When  $m$  is even

$$fog(m) = f(g(m)) = f(m + 1) = m + 1 - 1 = m$$

$$\therefore gof = I_W \text{ and } fog = I_W$$

Thus,  $f$  is invertible and the inverse of  $f$  is given by  $f^{-1} = g$ , which is the same as  $f$ . Hence, the inverse of  $f$  is  $f$  itself.

**Question 3:**

If  $f: \mathbf{R} \rightarrow \mathbf{R}$  is defined by  $f(x) = x^2 - 3x + 2$ , find  $f(f(x))$ .

**Answer 3:**

It is given that  $f: \mathbf{R} \rightarrow \mathbf{R}$  is defined as  $f(x) = x^2 - 3x + 2$ .

$$\begin{aligned} f(f(x)) &= f(x^2 - 3x + 2) \\ &= (x^2 - 3x + 2)^2 - 3(x^2 - 3x + 2) + 2 \\ &= (x^4 + 9x^2 + 4 - 6x^3 - 12x + 4x^2) + (-3x^2 + 9x - 6) + 2 \\ &= x^4 - 6x^3 + 10x^2 - 3x \end{aligned}$$

**Question 4:**

Show that function  $f: \mathbf{R} \rightarrow \{x \in \mathbf{R}: -1 < x < 1\}$  defined by  $f(x) = \frac{x}{1+|x|}$ ,  $x \in \mathbf{R}$  is one – one and onto function.

**Answer 4:**

It is given that  $f: \mathbf{R} \rightarrow \{x \in \mathbf{R}: -1 < x < 1\}$  is defined as  $f(x) = \frac{x}{1+|x|}$ ,  $x \in \mathbf{R}$ .

**For one – one**

Suppose  $f(x) = f(y)$ , where  $x, y \in \mathbf{R}$ .

$$\Rightarrow \frac{x}{1+|x|} = \frac{y}{1+|y|}$$

It can be observed that if  $x$  is positive and  $y$  is negative,

Then, we have

$$\frac{x}{1+x} = \frac{y}{1-y} \Rightarrow 2xy = x - y$$

Since,  $x$  is positive and  $y$  is negative

$$x > y \Rightarrow x - y > 0$$

But,  $2xy$  is negative.

Then  $2xy \neq x - y$

Thus, the case of  $x$  being positive and  $y$  being negative can be ruled out.

Under a similar argument,  $x$  being negative and  $y$  being positive can also be ruled out.

$\therefore x$  and  $y$  have to be either positive or negative.

When  $x$  and  $y$  are both positive, we have

$$f(x) = f(y) \Rightarrow \frac{x}{1+x} = \frac{y}{1+y} \Rightarrow x + xy = y + xy \Rightarrow x = y$$

When  $x$  and  $y$  are both negative, we have

$$f(x) = f(y) \Rightarrow \frac{x}{1-x} = \frac{y}{1-y} \Rightarrow x - xy = y - xy \Rightarrow x = y$$

$\therefore f$  is one – one.

**For onto**

Now, let  $y \in \mathbf{R}$  such that  $-1 < y < 1$ .

If  $y$  is negative, then, there exists  $x = \frac{y}{1+y} \in \mathbf{R}$  such that

$$f(x) = f\left(\frac{y}{1+y}\right) = \frac{\left(\frac{y}{1+y}\right)}{1 + \left|\frac{y}{1+y}\right|} = \frac{\frac{y}{1+y}}{1 + \left(\frac{-y}{1+y}\right)} = \frac{y}{1+y-y} = y$$

If  $y$  is positive, then, there exists  $x = \frac{y}{1-y} \in \mathbf{R}$  such that

$$f(x) = f\left(\frac{y}{1-y}\right) = \frac{\left(\frac{y}{1-y}\right)}{1 + \left|\frac{y}{1-y}\right|} = \frac{\frac{y}{1-y}}{1 + \left(\frac{y}{1-y}\right)} = \frac{y}{1-y+y} = y$$

$\therefore f$  is onto.

Hence,  $f$  is one – one and onto.

**Question 5:**

Show that the function  $f: \mathbf{R} \rightarrow \mathbf{R}$  given by  $f(x) = x^3$  is injective.

**Answer 5:**

$f: \mathbf{R} \rightarrow \mathbf{R}$  is given as  $f(x) = x^3$ .

For one – one

Suppose  $f(x) = f(y)$ , where  $x, y \in \mathbf{R}$ .

$$\Rightarrow x^3 = y^3 \dots\dots\dots (1)$$

Now, we need to show that  $x = y$ .

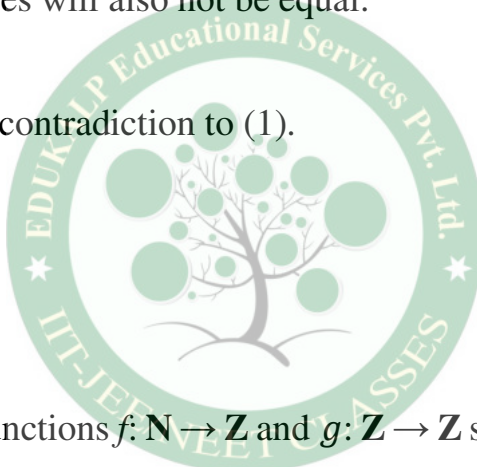

Suppose  $x \neq y$ , their cubes will also not be equal.

$$\Rightarrow x^3 \neq y^3$$

However, this will be a contradiction to (1).

$$\therefore x = y$$

Hence,  $f$  is injective.

**Question 6:**

Give examples of two functions  $f: \mathbf{N} \rightarrow \mathbf{Z}$  and  $g: \mathbf{Z} \rightarrow \mathbf{Z}$  such that  $g \circ f$  is injective but  $g$  is not injective.

(Hint: Consider  $f(x) = x$  and  $g(x) = |x|$ )

**Answer 6:**

Define  $f: \mathbf{N} \rightarrow \mathbf{Z}$  as  $f(x) = x$  and  $g: \mathbf{Z} \rightarrow \mathbf{Z}$  as  $g(x) = |x|$ .

We first show that  $g$  is not injective.

It can be observed that

$$g(-1) = |-1| = 1$$

$$g(1) = |1| = 1$$

$$\therefore g(-1) = g(1), \text{ but } -1 \neq 1.$$

$\therefore g$  is not injective.

Now,  $g$  of:  $\mathbf{N} \rightarrow \mathbf{Z}$  is defined as  $g \circ f(x) = g(f(x)) = g(x) = |x|$ .

Let  $x, y \in \mathbf{N}$  such that  $g \circ f(x) = g \circ f(y)$ .

$$\Rightarrow |x| = |y|$$

Since  $x$  and  $y \in \mathbf{N}$ , both are positive.

$$\therefore |x| = |y| \Rightarrow x = y$$

Hence,  $g \circ f$  is injective

### Question 7:

Given examples of two functions  $f: \mathbf{N} \rightarrow \mathbf{N}$  and  $g: \mathbf{N} \rightarrow \mathbf{N}$  such that  $g \circ f$  is onto but  $f$  is not onto.

(Hint: Consider  $f(x) = x + 1$  and  $g(x) = \begin{cases} x - 1, & \text{if } x > 1 \\ 1, & \text{if } x = 1 \end{cases}$ )

### Answer 7:

Define  $f: \mathbf{N} \rightarrow \mathbf{N}$  by  $f(x) = x + 1$

and  $g: \mathbf{N} \rightarrow \mathbf{N}$  by  $g(x) = \begin{cases} x - 1, & \text{if } x > 1 \\ 1, & \text{if } x = 1 \end{cases}$

We first show that  $g$  is not onto.

For this, consider element 1 in co-domain  $\mathbf{N}$ . It is clear that this element is not an image of any of the elements in domain  $\mathbf{N}$ .

$\therefore g$  is not onto.

Now,  $g \circ f: \mathbf{N} \rightarrow \mathbf{N}$  is defined by

$$g \circ f(x) = g(f(x)) = g(x + 1) = x + 1 - 1 = x \quad [x \in \mathbf{N} \Rightarrow x + 1 > 1]$$

Then, it is clear that for  $y \in \mathbf{N}$ , there exists  $x = y \in \mathbf{N}$  such that  $g \circ f(x) = y$ .

Hence,  $g \circ f$  is onto.

**Question 8:**

Given a non-empty set  $X$ , consider  $P(X)$  which is the set of all subsets of  $X$ .

Define the relation  $R$  in  $P(X)$  as follows:

For subsets  $A, B$  in  $P(X)$ ,  $ARB$  if and only if  $A \subset B$ . Is  $R$  an equivalence relation on  $P(X)$ ? Justify your answer.

**Answer 8:**

Since every set is a subset of itself,  $ARA$  for all  $A \in P(X)$ .

$\therefore R$  is reflexive.

Let  $ARB \Rightarrow A \subset B$ .

This cannot be implied to  $B \subset A$ .

For instance, if  $A = \{1, 2\}$  and  $B = \{1, 2, 3\}$ , then it cannot be implied that  $B$  is related to  $A$ .

$\therefore R$  is not symmetric.

Further, if  $ARB$  and  $BRC$ , then  $A \subset B$  and  $B \subset C$ .

$\Rightarrow A \subset C$

$\Rightarrow ARC$

$\therefore R$  is transitive.

Hence,  $R$  is not an equivalence relation as it is not symmetric.

**Question 9:**

Given a non-empty set  $X$ , consider the binary operation  $*$ :  $P(X) \times P(X) \rightarrow P(X)$  given by  $A * B = A \cap B \forall A, B$  in  $P(X)$  is the power set of  $X$ . Show that  $X$  is the identity element for this operation and  $X$  is the only invertible element in  $P(X)$  with respect to the operation  $*$ .

**Answer 9:**

It is given the binary operation  $*$ :

$P(X) \times P(X) \rightarrow P(X)$  given by  $A * B = A \cap B \forall A, B$  in  $P(X)$

We know that  $A \cap X = A = X \cap A$  for all  $A \in P(X)$

$\Rightarrow A * X = A = X * A$  for all  $A \in P(X)$

Thus,  $X$  is the identity element for the given binary operation  $*$ .

Now, an element  $A \in P(X)$  is invertible if there exists  $B \in P(X)$  such that

$$A * B = X = B * A \quad [\text{As } X \text{ is the identity element}]$$

or

$$A \cap B = X = B \cap A$$

This case is possible only when  $A = X = B$ .

Thus,  $X$  is the only invertible element in  $P(X)$  with respect to the given operation  $*$ .

Hence, the given result is proved.

**Question 10:**

Find the number of all onto functions from the set  $\{1, 2, 3, \dots, n\}$  to itself.

**Answer 10:**

Onto functions from the set  $\{1, 2, 3, \dots, n\}$  to itself is simply a permutation on  $n$  symbols  $1, 2, \dots, n$ .

Thus, the total number of onto maps from  $\{1, 2, \dots, n\}$  to itself is the same as the total number of permutations on  $n$  symbols  $1, 2, \dots, n$ , which is  $n!$ .

**Question 11:**

Let  $S = \{a, b, c\}$  and  $T = \{1, 2, 3\}$ . Find  $F^{-1}$  of the following functions  $F$  from  $S$  to  $T$ , if it exists.

(i)  $F = \{(a, 3), (b, 2), (c, 1)\}$

(ii)  $F = \{(a, 2), (b, 1), (c, 1)\}$

**Answer 11:**

$$S = \{a, b, c\}, \quad T = \{1, 2, 3\}$$

(i)  $F: S \rightarrow T$  is defined as  $F = \{(a, 3), (b, 2), (c, 1)\}$

$$\Rightarrow F(a) = 3, F(b) = 2, F(c) = 1$$

Therefore,  $F^{-1}: T \rightarrow S$  is given by  $F^{-1} = \{(3, a), (2, b), (1, c)\}$ .

(ii)  $F: S \rightarrow T$  is defined as  $F = \{(a, 2), (b, 1), (c, 1)\}$

Since  $F(b) = F(c) = 1$ ,  $F$  is not one – one.

Hence,  $F$  is not invertible i.e.,  $F^{-1}$  does not exist.

**Question 12:**

Consider the binary operations  $*$ :  $\mathbf{R} \times \mathbf{R} \rightarrow \mathbf{R}$  and  $\circ$ :  $\mathbf{R} \times \mathbf{R} \rightarrow \mathbf{R}$  defined as  $a * b = |a - b|$  and  $a \circ b = a$ ,  $\forall a, b \in \mathbf{R}$ . Show that  $*$  is commutative but not associative,  $\circ$  is associative but not commutative. Further, show that  $\forall a, b, c \in \mathbf{R}$ ,  $a*(b \circ c) = (a * b) \circ (a * c)$ . [If it is so, we say that the operation  $*$  distributes over the operation  $\circ$ ]. Does  $\circ$  distribute over  $*$ ? Justify your answer.

**Answer 12:**

It is given that  $*$ :  $\mathbf{R} \times \mathbf{R} \rightarrow \mathbf{R}$  and  $\circ$ :  $\mathbf{R} \times \mathbf{R} \rightarrow \mathbf{R}$  is defined as  $a * b = |a - b|$  and  $a \circ b = a$ ,  $\forall a, b \in \mathbf{R}$

For  $a, b \in \mathbf{R}$ , we have

$$a * b = |a - b| \text{ and } b * a = |b - a| = |-(a - b)| = |a - b|$$

$$\therefore a * b = b * a$$

Hence, the operation  $*$  is commutative.

It can be observed that

$$(1 * 2) * 3 = (|1 - 2|) * 3 = 1 * 3 = |1 - 3| = 2$$

and

$$1 * (2 * 3) = 1 * (|2 - 3|) = 1 * 1 = |1 - 1| = 0$$

$$\therefore (1 * 2) * 3 \neq 1 * (2 * 3) \text{ where } 1, 2, 3 \in \mathbf{R}.$$

Hence, the operation  $*$  is not associative.

Now, consider the operation  $\circ$

It can be observed that  $1 \circ 2 = 1$  and  $2 \circ 1 = 2$ .

$$\therefore 1 \circ 2 \neq 2 \circ 1 \text{ where } 1, 2 \in \mathbf{R}.$$

Hence, the operation  $\circ$  is not commutative.

Let  $a, b, c \in \mathbf{R}$ . Then, we have

$$(a \circ b) \circ c = a \circ c = a$$

and

$$a \circ (b \circ c) = a \circ b = a$$

$$\therefore a \circ b \circ c = a \circ (b \circ c), \text{ where } a, b, c \in \mathbf{R}$$

Hence, the operation  $\circ$  is associative.

Now, let  $a, b, c \in \mathbf{R}$ , then we have

$$a * (b \circ c) = a * b = |a - b|$$

$$(a * b) \circ (a * c) = (|a - b|) \circ (|a - c|) = |a - b|$$

$$\text{Hence, } a * (b \circ c) = (a * b) \circ (a * c).$$

Now,

$$1 \circ (2 * 3) = 1 \circ (|2 - 3|) = 1 \circ 1 = 1$$

$$(1 \circ 2) * (1 \circ 3) = 1 * 1 = |1 - 1| = 0$$

$$\therefore 1 \circ (2 * 3) \neq (1 \circ 2) * (1 \circ 3) \text{ where } 1, 2, 3 \in \mathbf{R}$$

Hence, the operation  $\circ$  does not distribute over  $*$ .

**Question 13:**

Given a non -empty set  $X$ , let  $*$ :  $P(X) \times P(X) \rightarrow P(X)$  be defined as  $A * B = (A - B) \cup (B - A)$ ,  $\forall A, B \in P(X)$ . Show that the empty set  $\Phi$  is the identity for the operation  $*$  and all the elements  $A$  of  $P(X)$  are invertible with  $A^{-1} = A$ .

(Hint:  $(A - \Phi) \cup (\Phi - A) = A$  and  $(A - A) \cup (A - A) = A * A = \Phi$ ).

**Answer 13:**

It is given that  $*$ :  $P(X) \times P(X) \rightarrow P(X)$  is defined

as  $A * B = (A - B) \cup (B - A) \forall A, B \in P(X)$ .

Let  $A \in P(X)$ . Then, we have

$$A * \Phi = (A - \Phi) \cup (\Phi - A) = A \cup \Phi = A$$

$$\Phi * A = (\Phi - A) \cup (A - \Phi) = \Phi \cup A = A$$

$$\therefore A * \Phi = A = \Phi * A \text{ for all } A \in P(X)$$

Thus,  $\Phi$  is the identity element for the given operation\*.

Now, an element  $A \in P(X)$  will be invertible if there exists  $B \in P(X)$  such that  $A * B = \Phi = B * A$ .

[As  $\Phi$  is the identity element]

Now, we observed that

$$A * A = (A - A) \cup (A - A) = \Phi \cup \Phi = \Phi \text{ for all } A \in P(X).$$

Hence, all the elements  $A$  of  $P(X)$  are invertible with  $A^{-1} = A$ .

**Question 14:**

Define a binary operation  $*$  on the set  $\{0, 1, 2, 3, 4, 5\}$  as

$$a * b = \begin{cases} a + b, & \text{if } a + b < 6 \\ a + b - 6, & \text{if } a + b \geq 6 \end{cases}$$

Show that zero is the identity for this operation and each element  $a \neq 0$  of the set is invertible with  $6 - a$  being the inverse of  $a$ .

**Answer 14:**

Let  $X = \{0, 1, 2, 3, 4, 5\}$ .

The operation  $*$  on  $X$  is defined as  $a * b = \begin{cases} a + b, & \text{if } a + b < 6 \\ a + b - 6, & \text{if } a + b \geq 6 \end{cases}$

An element  $e \in X$  is the identity element for the operation  $*$ , if

$$a * e = a = e * a \text{ for all } a \in X$$

For  $a \in X$ , we have

$$a * 0 = a + 0 = a \quad [a \in X \Rightarrow a + 0 < 6]$$

$$0 * a = 0 + a = a \quad [a \in X \Rightarrow 0 + a < 6]$$

$$\therefore a * 0 = a = 0 * a \text{ for all } a \in X$$

Thus, 0 is the identity element for the given operation  $*$ .

An element  $a \in X$  is invertible if there exists  $b \in X$  such that  $a * b = 0 = b * a$ .

$$\text{i.e., } \begin{cases} a + b = 0 = b + a, & \text{if } a + b < 6 \\ a + b - 6 = 0 = b + a - 6, & \text{if } a + b \geq 6 \end{cases}$$

$$\Rightarrow a = -b \text{ or } b = 6 - a$$

But,  $X = \{0, 1, 2, 3, 4, 5\}$  and  $a, b \in X$ . Then,  $a \neq -b$ .

$\therefore b = 6 - a$  is the inverse of  $a$  for all  $a \in X$ .

Hence, the inverse of an element  $a \in X$ ,  $a \neq 0$  is  $6 - a$  i.e.,  $a^{-1} = 6 - a$ .

**Question 15:**

Let  $A = \{-1, 0, 1, 2\}$ ,  $B = \{-4, -2, 0, 2\}$  and  $f, g: A \rightarrow B$  be functions defined by  $f(x) = x^2 - x$ ,  $x \in A$  and  $g(x) = 2 \left| x - \frac{1}{2} \right| - 1$ ,  $x \in A$ . Are  $f$  and  $g$  equal? Justify your answer. (Hint: One may note that two function  $f: A \rightarrow B$  and  $g: A \rightarrow B$  such that  $f(a) = g(a) \forall a \in A$ , are called equal functions).

**Answer 15:**

It is given that  $A = \{-1, 0, 1, 2\}$ ,  $B = \{-4, -2, 0, 2\}$ .

Also, it is given that  $f, g: A \rightarrow B$  are defined by

$$f(x) = x^2 - x, x \in A \text{ and } g(x) = 2 \left| x - \frac{1}{2} \right| - 1, x \in A$$

It is observed that

$$f(-1) = (-1)^2 - (-1) = 1 + 1 = 2$$

$$\text{and } g(-1) = 2 \left| (-1) - \frac{1}{2} \right| - 1 = 2 \left( \frac{3}{2} \right) - 1 = 3 - 1 = 2$$

$$\Rightarrow f(-1) = g(-1)$$

$$f(0) = (0)^2 - (0) = 0$$

$$\text{and } g(0) = 2 \left| 0 - \frac{1}{2} \right| - 1 = 2 \left( \frac{1}{2} \right) - 1 = 1 - 1 = 0$$

$$\Rightarrow f(0) = g(0)$$

$$f(1) = (1)^2 - (1) = 1 - 1 = 0$$

$$\text{and } g(1) = 2 \left| (1) - \frac{1}{2} \right| - 1 = 2 \left( \frac{1}{2} \right) - 1 = 1 - 1 = 0$$

$$\Rightarrow f(1) = g(1)$$

$$f(2) = (2)^2 - (2) = 4 - 2 = 2$$

$$\text{And } g(2) = 2 \left| (2) - \frac{1}{2} \right| - 1 = 2 \left( \frac{3}{2} \right) - 1 = 3 - 1 = 2$$

$$\Rightarrow f(2) = g(2)$$

$$\therefore f(a) = g(a) \text{ for all } a \in A$$

Hence, the functions  $f$  and  $g$  are equal.

**Question 16:**

Let  $A = \{1, 2, 3\}$ . Then number of relations containing  $(1, 2)$  and  $(1, 3)$  which are reflexive and symmetric but not transitive is

- (A) 1                      (B) 2                      (C) 3                      (D) 4

**Answer 16:**

The given set is  $A = \{1, 2, 3\}$ .

The smallest relation containing  $(1, 2)$  and  $(1, 3)$  which is reflexive and symmetric, but not transitive is given by:

$$R = \{(1, 1), (2, 2), (3, 3), (1, 2), (1, 3), (2, 1), (3, 1)\}$$

This is because relation  $R$  is reflexive as  $(1, 1), (2, 2), (3, 3) \in R$ .

Relation  $R$  is symmetric since  $(1, 2), (2, 1) \in R$  and  $(1, 3), (3, 1) \in R$ .

But relation  $R$  is not transitive as  $(3, 1), (1, 2) \in R$ , but  $(3, 2) \notin R$ .

Now, if we add any two pairs  $(3, 2)$  and  $(2, 3)$  (or both) to relation  $R$ , then relation  $R$  will become transitive.

Hence, the total number of desired relations is one.

The correct answer is A.

**Question 17:**

Let  $A = \{1, 2, 3\}$ . Then number of equivalence relations containing  $(1, 2)$  is

- (A) 1                      (B) 2                      (C) 3                      (D) 4

**Answer 17:**

It is given that  $A = \{1, 2, 3\}$ .

The smallest equivalence relation containing  $(1, 2)$  is given by,

$$R_1 = \{(1, 1), (2, 2), (3, 3), (1, 2), (2, 1)\}$$

Now, we are left with only four pairs i.e.,  $(2, 3), (3, 2), (1, 3)$ , and  $(3, 1)$ .

If we add any one pair [say (2, 3)] to  $R_1$ , then for symmetry we must add (3, 2).

Also, for transitivity we are required to add (1, 3) and (3, 1).

Hence, the only equivalence relation (bigger than  $R_1$ ) is the universal relation.

This shows that the total number of equivalence relations containing (1, 2) is two.

The correct answer is B.

### Question 18:

Let  $f: \mathbf{R} \rightarrow \mathbf{R}$  be the Signum Function defined as  $f(x) = \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases}$

and  $g: \mathbf{R} \rightarrow \mathbf{R}$  be the Greatest Integer Function given by  $g(x) = [x]$ , where  $[x]$  is greatest integer less than or equal to  $x$ . Then does  $f \circ g$  and  $g \circ f$  coincide in (0, 1]?

### Answer 18:

It is given that,

$f: \mathbf{R} \rightarrow \mathbf{R}$  is defined as  $f(x) = \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases}$

Also,  $g: \mathbf{R} \rightarrow \mathbf{R}$  is defined as  $g(x) = [x]$ , where  $[x]$  is the greatest integer less than or equal to  $x$ .

Now, let  $x \in (0, 1]$ .

Then, we have

$[x] = 1$  if  $x = 1$  and  $[x] = 0$  if  $0 < x < 1$ .

$$\begin{aligned} f \circ g(x) &= f(g(x)) = f([x]) = \begin{cases} f(1), & \text{if } x = 1 \\ f(0), & \text{if } x \in (0, 1) \end{cases} \\ &= \begin{cases} 1, & \text{if } x = 1 \\ 0, & \text{if } x \in (0, 1) \end{cases} \end{aligned}$$

$$\begin{aligned} g \circ f(x) &= g(f(x)) = g(1) \quad [ \text{as } x > 0 ] \\ &= [1] = 1 \end{aligned}$$

Thus, when  $x \in (0, 1)$ , we have  $f \circ g(x) = 0$  and  $g \circ f(x) = 1$ .

Hence,  $f \circ g$  and  $g \circ f$  do not coincide in  $(0, 1]$ .

**Question 19:**

Number of binary operations on the set  $\{a, b\}$  are

- (A) 10                      (B) 16                      (C) 20                      (D) 8

**Answer 19:**

A binary operation  $*$  on  $\{a, b\}$  is a function from  $\{a, b\} \times \{a, b\} \rightarrow \{a, b\}$   
i.e.,  $*$  is a function from  $\{(a, a), (a, b), (b, a), (b, b)\} \rightarrow \{a, b\}$ .

Hence, the total number of binary operations on the set  $\{a, b\}$  is  $2^4$  i.e., 16.

The correct answer is B.
